

For the project part 1, we brainstormed together the theme of the project. Then we started collaborating on the text description and drawing the ER diagram together. For the schema.sql file, we divided the schema into 2 half and each wrote the schema for the assigned section. I worked on the entity sets inside the university entity cluster and yuqi worked on the ones outside the cluster.

For project part 2, We edited the ER diagram, text description as well as the schema.sql file together based on the TA feedback. Then for the tables inside the university cluster, I populated the table with csv obtained from leetcode and Albert, and yuqi did the same thing for tables outside the cluster. Then for the user interactions, I wrote the query for the first 7 interactions and put them inside the project.py file and then tested it on the streamlite app. Then we worked together on the Tmux, and then produced the presentation as well as the recording.
